How This API Document Is Organized

This API (Application Programming Interface) document has pages corresponding to the items in the navigation bar, described as follows.

Module

Each module has a page that contains a list of its packages, dependencies on other modules, and services, with a summary for each. These pages may contain three categories:

- Packages
- Modules
- Services

Package

Each package has a page that contains a list of its classes and interfaces, with a summary for each. These pages may contain six categories:

- Interfaces
- Classes
- Enum Classes
- Exceptions
- Errors
- Annotation Interfaces

Class or Interface

Each class, interface, nested class and nested interface has its own separate page. Each of these pages has three sections consisting of a class/interface description, summary tables, and detailed member descriptions:

- Class Inheritance Diagram
- Direct Subclasses
- All Known Subinterfaces
- All Known Implementing Classes
- Class or Interface Declaration
- Class or Interface Description

All Classes

- Nested Class Summary
- Field Summary
- Property Summary
- Constructor Summary
- Method Summary

- Field Details
- Property Details
- Constructor Details
- Method Details

The summary entries are alphabetical, while the detailed descriptions are in the order they appear in the source code. This preserves the logical groupings established by the programmer.

Annotation Interface

Each annotation interface has its own separate page with the following sections:

- Annotation Interface Declaration
- Annotation Interface Description
- Required Element Summary
- Optional Element Summary
- Element Details

Enum Class

Each enum class has its own separate page with the following sections:

- Enum Declaration
- Enum Description
- Enum Constant Summary
- Enum Constant Details

Tree (Class Hierarchy)

There is a [Class Hierarchy](#) page for all packages, plus a hierarchy for each package. Each hierarchy page contains a list of classes and a list of interfaces. Classes are organized by inheritance structure starting with `java.lang.Object`. Interfaces do not inherit from `java.lang.Object`.

- When viewing the Overview page, clicking on "Tree" displays the hierarchy for all packages.
- When viewing a particular package, class or interface page, clicking on "Tree" displays the hierarchy for only that package.

Index

The [Index](#) contains an alphabetic index of all classes, interfaces, constructors, methods, and fields, as well as lists of all packages and all classes.

Search

You can search for definitions of modules, packages, types, fields, methods, system properties and other terms defined in the API, using some or all of the name, optionally using "camel-case" abbreviations. For example:

- `j.l.obj` will match "java.lang.Object"
- `InpStr` will match "java.io.InputStream"
- `HM.cK` will match "java.util.HashMap.containsKey(Object)"

Refer to [the Javadoc Search Specification](#) for a full description of search features.

This help file applies to API documentation generated by the standard doclet.

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`,
`toString`, `wait`, `wait`, `wait`

• Constructor Details

◆ IssueBoard

`public IssueBoard (String projectName)`
Constructor for Project. Creates three empty lists, that can be filled with Tasks
Parameters:
 projectName - Name of the project as String

• Method Details

◆ getTodoTasks

`public List<Task> getTodoTasks()`
Returns the todoTasks list
Returns:

All Classes

The list contained in the 'todoTasks' variable

◆ **getOngoingTasks**

public List<Task> getOngoingTasks()

Returns the ongoingTasks

Returns:

The list contained in the 'ongoingTasks' variable

◆ **getFinishedTasks**

public List<Task> getFinishedTasks()

Returns the finishedTasks

Returns:

The list contained in the 'finishedTasks' variable

◆ **addTask**

public void addTask (Task task)

Adds a task to ArrayList todoTasks

Specified by:

addTask in class Project

Parameters:

task - The Task object to be added

◆ **removeTask**

public void removeTask (Task task)

Removes a task from the project. Checks if the task exists in either of the lists and removes it if found Throws NoSuchElementException if no task is found

Specified by:

removeTask in class Project

Parameters:

task - The Task object to be removed

◆ **removeTask**

public void removeTask (Task task, List<Task> list)

Same as other removeTask, but easier if you know the list

Specified by:

removeTask in class Project

Parameters:

task - The task object to be removed

list - The list that contains the task

◆ **moveTask**

public void moveTask (Task task, List<Task> oldList, List<Task> newList)

Moved a task, from one list, to another

Specified by:

moveTask in class Project

Parameters:

task - the task to be moved

oldList - the old list of the task

newList - the new list of the task

Throws:

All Classes

IllegalArgumentException - thrown if task == null

◆ **getList**

public List<Task> getList (Task task)

Finds the current list that contains the task.

Parameters:

task -

All Methods Instance Methods Concrete Methods

Modifier and Type

Method

Description

void

doAddTask (javafx.event.ActionEvent actionEvent)

Adds a new task.

void

doEditTask (javafx.event.ActionEvent actionEvent)

Edit the selected task.

void

doMoveTask (javafx.event.ActionEvent actionEvent)

Move task from one list to the other.

void

doRemoveTask (javafx.event.ActionEvent actionEvent)

Removes selected task from either lists.

void

doViewDetails (javafx.event.ActionEvent actionEvent)

View details of the task.

void

initialize (URL url, ResourceBundle resourceBundle)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll,
toString, wait, wait, wait

• Constructor Details

◆ MainController

public MainController()

• Method Details

◆ initialize

public void initialize (URL url, ResourceBundle resourceBundle)

Specified by:

initialize in interface javafx.fxml.Initializable

◆ doViewDetails

public void doViewDetails (javafx.event.ActionEvent actionEvent)

View details of the task.

Parameters:

actionEvent - triggers the method on double click.

◆ doAddTask

public void doAddTask (javafx.event.ActionEvent actionEvent)

Adds a new task.

Parameters:

actionEvent - triggers the method.

◆ **doRemoveTask**

```
public void doRemoveTask (javafx.event.ActionEvent actionEvent)
```

Removes selected task from either lists. If no task is highlighted show dialog.

◆ **doMoveTask**

```
public void doMoveTask (javafx.event.ActionEvent actionEvent)
```

Move task from one list to the other.

◆ **doEditTask**

```
public void doEditTask (javafx.event.ActionEvent actionEvent)
```

Edit the selected task.

Parameters:

`actionEvent` - the event triggering the action*

getTimeLeft()

Returns days left until deadline

String

getTimeLeftUntilDeadline()

int

getYear()

void

setDay (int day)

Sets the priority.

void

setDeadline (int year, int month, int day)

Sets new deadline for a task

void

setDescription (String description)

Sets the description.

void

setMonth (int month)

Sets the priority.

void

setPriority (String priority)

Sets the priority.

void

setTaskName (String taskName)

Sets the task name

void

setYear (int year)

- Sets the priority.

String
toString()

void
updateTimeLeft()
Updates time left

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll,
wait, wait, wait

• Constructor Details

◆ Task

public Task (String taskName, String description, String priority, int year, int month, int day)
Creates an instance of TodoTask. Note how mutator-methods are used to set the fields instead of setting the fields directly.

Parameters:

taskName - the name of the task
description - a more detailed description of the task // * @param year year of the
deadline // * @param month month of the deadline // * @param day day of the
month, of the deadline

◆ Task

public Task (String category, String taskName, String description, int timeLeft)
Default constructor. Creates an instance of Task. Sets the fields to empty strings to avoid
NullPointerException.

Parameters:

category -
taskName -
description -
timeLeft -

• Method Details

◆ getTaskName

public String getTaskName()
Returns the name of task.
Returns:
the name of task

◆ getDescription

public String getDescription()
Returns the description.
Returns:
the description

◆ **getTimeLeft**

```
public long getTimeLeft()
```

Returns days left until deadline

Returns:

The amount of days left to finish the task

◆ **getTimeLeftUntilDeadline**

```
public String getTimeLeftUntilDeadline()
```

◆ **setDeadLine**

```
public void setDeadLine (int year, int month, int day)
```

Sets new deadline for a task

Parameters:

`year` - year of the deadline

`month` - month of the deadline

`day` - day of the month, of the deadline

◆ **updateTimeLeft**

```
public void updateTimeLeft()
```

Updates time left

◆ **setTaskName**

```
public void setTaskName (String taskName)
```

Sets the task name

Parameters:

`taskName` - the name of task

◆ **setDescription**

```
public void setDescription (String description)
```

Sets the description.

Parameters:

`description` - the description of the task

◆ **setPriority**

```
public void setPriority (String priority)
```

Sets the priority.

Parameters:

`priority` - the description of the task

◆ **setMonth**

```
public void setMonth (int month)
```

Sets the priority.

Parameters:

`month` - the month

◆ **setYear**

public void setYear (int year)

Sets the priority.

Parameters:

year - the description of the task

◆ **setDay**

public void setDay (int day)

Sets the priority.

Parameters:

day - the description of the task

◆ **toString**

public String toString()

Overrides:

toString in class Object

◆ **getYear**

public int getYear()

◆ **getMonth**

public int getMonth()

◆ **getDay**

public int getDay()

◆ **getPriority**

public String getPriority()

• Method Details

◆ values

public static TaskDialog.Mode[] values()

Returns an array containing the constants of this enum class, in the order they are declared.

Returns:

an array containing the constants of this enum class, in the order they are declared

◆ valueOf

public static TaskDialog.Mode valueOf (String name)

Returns the enum constant of this class with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this class. (Extraneous whitespace characters are not permitted.)

Parameters:

name - the name of the enum constant to be returned.

Returns:

the enum constant with the specified name

Throws:

IllegalArgumentException - if this enum class has no constant with the specified name

NullPointerException - if the argument is null
